1) a dye of formula (1):

wherein:

Q¹ and Q⁴, which are the same or different, are each unsubstituted or substituted phenyl or naphthyl;Q² and Q³, which are the same or different, are each unsubstituted or substituted phenylene; and
X is -N=N- orprovided that, when X is -N=N- and both of Q² and Q³ are unsubstituted phenylene, at least one of Q¹ and Q⁴ is not phenyl which is substituted only by an alkyl-substituted amino or is not phenyl substituted by an alkyl-substituted amino and by methyl; and

2) a dye of formula (2):

wherein:

each Me, which are the same or different, is a transition metal selected from copper, nickel, zinc and iron;

Q⁵ and Q⁶, which are the same or different, are each an unsubstituted or substituted 1,2-naphthalene group;

Y is -N=N- or

EP 0 648 814 A1

-N=N-;

·
·

and

R¹ and R², which are the same or different, are each hydrogen, lower alkyl, lower alkoxy or sulfo.

This invention relates to a polarizing film containing dye.

Currently, polarizing films are generally prepared by incorporating iodine or a dichromatic dye as a polarizing element into an oriented film made of polyvinyl alcohol or its derivatives, or into an oriented polyene film prepared by dehydrochlorination of a polyvinyl chloride film or dehydration of a polyvinyl alcohol film so as to produce polyene in the film, followed by the orientation of the resulting film.

Among those, a iodine-containing polarizing film is good in early stage polarizing activities, but poor in the durability to moisture and heat. Thus, the film has some drawbacks in the lowered polarizing activities after having been used for a certain period of time at a high temperature under a highly humid condition. Several methods for improving the durability have been proposed, in which the film is treated with formalin or aqueous boric acid solution, or a polymer film having a low moisture permeability is employed as a protecting film, but these methods are not yet fully satisfactory.

A dye-containing polarizing films using a dichromatic dye as a polarizing element is superior in the durability to moisture and heat as compared with those in iodine-containing polarizing film, but inferior in the early stage polarizing activities.

If two polarizing films of neutral color containing two or more kinds of dichromatic dyes which are superposed on each other so that those orientation directions meet at right angles (hereinafter, this state is referred to as "crossed state") are pervious to light of a specific wavelength within the visible radiation wavelength region, particularly from 400 to 700nm, a liquid crystal display using the two films often show a color different from the intended color at dark state.

In order to prevent the problem due to the light breaking through the films, transmittance of the polarizing films at crossed state (hereinafter, this is referred to as "cross light transmittance") must be lowered over the visible radiation wavelength region, particularly from 400 to 700nm.

An object of the present invention is to provide a polarizing film of neutral color containing two or more kinds of dichromatic dyes which is excellent in the polarizing activities as well as the durability to moisture and heat.

Other object of the present invention is to provide a polarizing film of neutral color containing two or more kinds of dichromatic dyes which is excellent in the polarizing activities as well as the durability to moisture and heat and is little pervious to light over the visible radiation wavelength region, particularly 400 to 700nm at crossed state.

Further object of the present invention is to provide dye which can be used suitably for producing said polarizing film.

The present inventors have extensively studied to accomplish these objects, have found that a polarizing film of neutral color containing specific dyes exhibits excellent polarizing activities and durability to moisture and heat and is little pervious to light at crossed state over the visible radiation wavelength region, particularly 400 to 700nm.

The present invention provides a dye-containing polarizing film comprising at least one kind of dye selected from dye represented by the following formula(1):

wherein Q1 and Q4 are same or different and each independently phenyl or naphthyl group which may be optionally substituted, Q2 and Q3 are same or different and each independently phenylene group which may be optionally substituted, X is -N=N- or

provided that when X is -N=N- and both of Q2 and Q3 are unsubstituted phenylene groups, at least one of Q1 and Q4 is not phenyl group which is substituted by alkyl-substituted amino group only or phenyl group which is substituted by alkyl-substituted amino group and methyl group.

and dye represented by the following formula(2):

wherein Me is transition metal selected from copper, nickel, zinc and iron, Q⁵ and Q⁶ are same or different and each independently 1-naphthol or 2-naphthol residue which may be optionally substituted wherein the hydroxy groups are adjacent to the azo groups and linked with the transition metals Me to form the complex. Y is -N=N- or

R¹ and R² are same or different and each independently hydrogen atom, lower alkyl, lower alkoxy or sulfo group, in a film substrate.

In this specification, the term "lower" used to qualify a group such as alkyl or alkoxy means "having one to about four carbon atoms."

The dye-containing polarizing film of the present invention may further comprises other organic dye. Particularly, it is preferred that the polarizing film further comprises two or more kinds of dye selected from the following groups [A], [B] and [C]:

[A] A group consisting of disazo dyes represented by the following formula(3).

wherein Me' is transition metal selected from copper, nickel, zinc and iron, A¹ is phenyl or naphthyl group which may be optionally substituted, B¹ is 1-naphthol or 2-naphthol residue which may be optionally substituted wherein the hydroxy group is adjacent to the azo group and linked with the transition metal Me' to form the complex (i.e. a 1,2-naphthalene group in which one of position 1 or 2 is linked to the oxygen atom and the other is linked to the -N=N-group), and R³ is amino group which may be optionally substituted, hydrogen atom, lower alkyl, lower alkoxy or sulfo group

[B] A group consisting of trisazo dyes represented by the following formula(4) in the free acid form and copper complex salts thereof.

wherein A² and B² are same or different and each independently phenyl or naphthyl group which may be optionally substituted, R⁴ is amino group which may be optionally substituted, hydrogen atom, lower alkyl, lower alkoxy or sulfo group, R⁵ is hydrogen atom, hydroxy or lower alkoxy group and m is 0 or 1; and [C] A group consisting of C.I. Direct Yellow 12, C.I. Direct Yellow 28, C.I. Direct Yellow 44, C.I. Direct Orange 26, C.I. Direct Orange 39, C.I. Direct Orange 107, C.I. Direct Red 2, C.I. Direct Red 31, C.I. Direct Red 79,

C.I. Direct Red 81 and C.I. Direct Red 247.

Accordingly the present invention also provides a dye-containing polarizing film which comprises, at least one type of dye selected from dye represented by the formula(1) and dye represented by the formula(2), and at least two types of dyes selected from the group [A], [B] and [C].

Q1 and Q4 in the formula(1) are same or different and each independently phenyl or naphthyl group which may be optionally substituted. Examples of groups which can be a substituent of the phenyl or naphthyl group denoted by Q1 or Q4 include amino which may be optionally substituted, sulfo, carboxy, hydroxy, lower alkyl and lower alkoxy. Preferably, Q1 and Q4 are same or different and each independently naphthyl group which is substituted by at least one group selected from amino which may be optionally substituted, sulfo, hydroxy, lower alkyl or lower alkoxy; or phenyl group which is substituted by at least one group selected from amino which may be optionally substituted and hydroxy, and may further substituted by sulfo, carboxy, lower alkyl or lower alkoxy. Among them, particularly preferable as Q1 or Q4 is a naphthyl group substituted by at least one group selected from amino which may be optionally substituted, sulfo, hydroxy, lower alkyl and lower alkoxy.

Q2 and Q3 in the formula(1) are same or different and each independently phenylene which may be optionally substituted. Examples of groups which can be a substituent of the phenylene group denoted by Q2 or Q3 include hydroxy, lower alkyl, lower alkoxy and sulfo. Preferably, Q2 and Q3 are same or different and each independently unsubstituted phenylene group or phenylene group substituted by one or two substituent selected from hydroxy, lower alkyl, lower alkoxy and sulfo. Among the preferable phenylene mentioned-above, p-phenylene group is particularly preferred. Preferred phenylene denoted by Q2 or Q3 can be represented by following formula:

wherein R6 and R7 are same or different and each independently hydrogen, hydroxy, lower alkyl, lower alkoxy or sulfo.

Q5 and Q6 in the formula(2) are same or different and each independently 1-naphthol or 2-naphthol residue which may be optionally substituted. Examples of groups which can be a substituent of the naphthol group denoted by Q5 or Q6 include amino which may be optionally substituted, sulfo, hydroxy, carboxy, lower alkyl and lower alkoxy. Preferably, Q5 and Q6 are same or different and each independently 1-naphthol or 2-naphthol residue which is substituted by amino which may be optionally substituted, sulfo, hydroxy, carboxy, lower alkyl or lower alkoxy.

Me in the formula(2) is a transition metal selected from copper, nickel, zinc and iron. Particularly, copper is preferred.

The amino group as a substituent of Q1, Q4, Q5 or Q6 in the formula(1) or (2) may be unsubstituted or substituted. When the amino group is a substituent of the phenyl group, the substituted amino group is mono-substituted or di-substituted amino group. Examples of the substituent of the amino group include methyl, ethyl, hydroxyethyl, cyanoethyl, acetyl and carbamoyl. When the amino group is a substituent of the naphthyl group, the substituted amino group is mono-substituted or di-substituted amino group. Examples of the substituent of the amino group include methyl, ethyl, hydroxyethyl, cyanoethyl, acetyl, carbamoyl, phenyl, sulfo-phenyl, disulfophenyl and benzoyl.

The dye-containing polarizing film comprising at least one types of dye selected from the dye of the formula(1) and the dye of the formula(2) is excellent in the polarizing activities and in the durability to moisture and heat, that is, the polarizing activities is not lowered and the color is not discolored even after having been used for a certain period of time at a high temperature under a highly humid condition.

The dye of the formula(1) can be produced, for example, by mixing a monoazo compound represented by the following formula(5):

wherein Q1 and Q2 are as defined above and a monoazo compound represented by the following formula(6):

wherein Q3 and Q4 are as defined above, followed by the glucose reduction in aqueous medium. The glucose

reduction can be carried out according to a known method, such as a method described in Ind. Eng. Chem., 27, 1045 (1935) or J. Am. Chem. Soc., 73, 1323 (1951).

The monoazo compound represented by the formula(5) can be produced, for example, by diazotizing a compound represented by the following formula (5-a) in a usual method:

wherein Q2 is as defined above, and coupling the resulting diazonium compound with a compound represented by the following formula(5-b);

wherein Q1 is as defined above.

The monoazo compound represented by the formula(6) can be produced, for example, by diazotizing a compound represented by the following formula(6-a) in a usual method;

wherein Q3 is as defined above, and coupling the resulting diazonium compound with a compound represented by the following formula(6-b);

wherein Q4 is as defined above.

The dye of the formula(2) can be produced, for example, by mixing a monoazo compound represented by the following formula(7).

wherein Q5 and R1 are as defined above and R8 is hydrogen or lower alkyl, and a monoazo compound represented by the following formula(8).

wherein Q6 and R2 are as defined above and R9 is hydrogen or lower alkyl; and carrying out the glucose reduction in aqueous medium to obtain a trisazo compound or a disazomonoazoxy compound, followed by forming a complex salt of the compound by a reaction with copper, nickel, zinc or iron-containing compound. The glucose reduction can be carried out according to a known method.

The monoazo compound represented by the formula(7) can be produced, for example, by diazotizing a compound represented by the following formula(7-a) in a usual method;

wherein R1 and R8 are as defined above, and coupling the resulting diazonium compound with a compound represented by the following formula(7-b);

wherein Q5 is as defined above.

The monoazo compound represented by the formula(8) can be produced, for example, by diazotizing a compound represented by the following formula(8-a) in a usual method;

wherein R² and R⁹ are as defined above, and coupling the resulting diazonium compound with a compound represented by the following formula(8-b);

wherein Q6 is as defined above.

Examples of the nitroaniline compound of the formula(5-a) or (6-a) include 4-nitroaniline, 2-methyl-4-nitroaniline, 2-ethyl-4-nitroaniline, 2-methoxy-4-nitroaniline, 2-ethoxy-4-nitroaniline, 2,5-dimethoxy-4-nitroaniline, 3-sulfo-4-nitroaniline and 2-hydroxy-4-nitroaniline. Among them, 4-nitroaniline and 2-methoxy-4-nitroaniline are preferred.

The compound represented by the formula(5-b) or (6-b) may be unsubstituted or substituted benzene or unsubstituted or substituted naphthalene. Examples of the compound of the formula(5-b) or (6-b) include aniline, aniline derivatives, phenol, phenol derivatives, aminophenol, amino phenol derivatives, naphthol, naphthol derivatives, naphthoic acid, naphthoic acid derivatives, naphthylamine sulfonic acid, naphthylamine sulfonic acid derivatives, naphthol sulfonic acid and naphthol sulfonic acid derivatives.

Among them, the following can be mentioned as preferred examples.

phenol, o-cresol, m-cresol, p-cresol, resorcinol, phloroglucinol, m-methoxyphenol, m-aminophenol, 3-(diethylamino)phenol, 5-amino-2-methylphenol, 3-[bis(β-hydroxyethyl)amino]phenol, N,N-bis(β-hydroxyethyl)aniline, 1,3-diamino-4-methylbenzene, salicylic acid, 1,3-diaminobenzene-4-sulfonic acid, 1,3-diaminobenzene-4,6-disulfonic acid, 1-acetyl-amino-4-methoxy-3-[bis(β-hydroxyethyl)amino]benzene, 3-(diethylamino)phenol, 1-naphthol, 1-hydroxy-2-naphthoic acid, 1-naphthol-4-sulfonic acid, 1-naphthol-5-sulfonic acid, 1-naphthol-3-sulfonic acid, 1-naphthol-3,8-disulfonic acid, 1-naphthol-3,6-disulfonic acid, 1-naphthol-3,6,8-trisulfonic acid, 2-naphthol, 3-hydroxy-2-naphthoic acid, 2-naphthol-8-sulfonic acid, 2-naphthol-7-sulfonic acid, 2-naphthol-6-sulfonic acid, 2-naphthol-6,8-disulfonic acid, 2-naphthol-3,6-disulfonic acid, 1-aminonaphthalene-6-sulfonic acid, 1-aminonaphthalene-7-sulfonic acid, 2-aminonaphthalene-6-sulfonic acid, 2-amino-8-hydroxynaphthalene-6-sulfonic acid, 2-methylamino-8-hydroxynaphthalene-6-sulfonic acid, 2-ethylamino-8-hydroxynaphthalene-6-sulfonic acid, 2-acetyl-amino-8-hydroxynaphthalene-6-sulfonic acid, 2-propionylamino-8-hydroxynaphthalene-6-sulfonic acid, 2-benzoylamino-8-hydroxynaphthalene-6-sulfonic acid, 2-carbamoylamino-8-hydroxynaphthalene-6-sulfonic acid, 2-sulfamoylamino-8-hydroxynaphthalene-6-sulfonic acid, 2-phenylamino-8-hydroxynaphthalene-6-sulfonic acid, 3-amino-8-hydroxynaphthalene-6-sulfonic acid, 3-methylamino-8-hydroxynaphthalene-6-sulfonic acid, 3-ethylamino-8-hydroxynaphthalene-6-sulfonic acid, 3-acetyl-amino-8-hydroxynaphthalene-6-sulfonic acid, 3-propionylamino-8-hydroxynaphthalene-6-sulfonic acid, 3-benzoylamino-8-hydroxynaphthalene-6-sulfonic acid, 3-carbamoylamino-8-hydroxynaphthalene-6-sulfonic acid, 3-sulfamoylamino-8-hydroxynaphthalene-6-sulfonic acid, 3-phenylamino-8-hydroxynaphthalene-6-sulfonic acid, 1-amino-5-hydroxynaphthalene-7-sulfonic acid, 1-amino-8-hydroxynaphthalene-3,6-disulfonic acid, 1-acetyl-amino-8-hydroxynaphthalene-3,6-disulfonic acid, 1-amino-8-hydroxynaphthalene-4,6-disulfonic acid, 1-acetyl-amino-8-hydroxynaphthalene-4,6-disulfonic acid, 1-amino-8-hydroxynaphthalene-2,4-disulfonic acid, 2-amino-8-hydroxynaphthalene-3,6-disulfonic acid, 2-amino-5-hydroxynaphthalene-1,7-disulfonic acid and 1,8-dihydroxynaphthalene-3,6-disulfonic acid.

Among them, 1-amino-8-hydroxynaphthalene-2,4-disulfonic acid, 1-amino-8-hydroxynaphthalene-3,6-disulfonic acid, 1-amino-8-hydroxynaphthalene-4,6-disulfonic acid and 2-amino-5-hydroxynaphthalene-1,7-disulfonic acid are particularly preferred.

Examples of the nitroaniline compound of the formula(7-a) or (8-a) include 2-methoxy-4-nitroaniline, 2-methoxy-4-nitro-5-methylaniline, 2,5-dimethoxy-4-nitroaniline, 2-hydroxy-4-nitroaniline and 2-methoxy-4-nitro-5-ethoxylaniline. Among them, 2-methoxy-4-nitroaniline is preferred.

The compound represented by the formula(7-b) or (8-b) is unsubstituted or substituted naphthol. Examples of the compound of the formula(7-b) or (8-b) include 1-naphthol, 1-naphthol-4-sulfonic acid, 1-naphthol-5-sulfonic acid, 1-naphthol-3-sulfonic acid, 1-naphthol-3,8-disulfonic acid, 1-naphthol-3,6-disulfonic acid, 1-

naphthol-3,6,8-trisulfonic acid, 2-naphthol, 2-naphthol-3-carboxylic acid, 2-naphthol-8-sulfonic acid, 2-naphthol-7-sulfonic acid, 2-naphthol-6-sulfonic acid, 2-naphthol-6,8-disulfonic acid, 2-naphthol-3,6-disulfonic acid, 2-amino-8-hydroxynaphthalene-6-sulfonic acid, 2-methylamino-8-hydroxynaphthalene-6-sulfonic acid, 2-ethylamino-8-hydroxynaphthalene-6-sulfonic acid, 2-acetylamino-8-hydroxynaphthalene-6-sulfonic acid, 2-propionylamino-8-hydroxynaphthalene-6-sulfonic acid, 2-benzoylamino-8-hydroxynaphthalene-6-sulfonic acid, 2-carbamoylamino-8-hydroxynaphthalene-6-sulfonic acid, 2-sulfamoylamino-8-hydroxynaphthalene-6-sulfonic acid, 2-phenylamino-8-hydroxynaphthalene-6-sulfonic acid, 3-amino-8-hydroxynaphthalene-6-sulfonic acid, 3-methylamino-8-hydroxynaphthalene-6-sulfonic acid, 3-ethylamino-8-hydroxynaphthalene-6-sulfonic acid, 3-acetylamino-8-hydroxynaphthalene-6-sulfonic acid, 3-propionylamino-8-hydroxynaphthalene-6-sulfonic acid, 3-benzoylamino-8-hydroxynaphthalene-6-sulfonic acid, 3-carbamoylamino-8-hydroxynaphthalene-6-sulfonic acid, 3-sulfamoylamino-8-hydroxynaphthalene-6-sulfonic acid, 3-phenylamino-8-hydroxynaphthalene-6-sulfonic acid, 1-amino-5-hydroxynaphthalene-7-sulfonic acid, 1-amino-8-hydroxynaphthalene-3,6-disulfonic acid, 1-acetylamino-8-hydroxynaphthalene-3,6-disulfonic acid, 1-amino-8-hydroxynaphthalene-4,6-disulfonic acid, 1-acetylamino-8-hydroxynaphthalene-4,6-disulfonic acid, 1-amino-8-hydroxynaphthalene-2,4-disulfonic acid, 2-amino-8-hydroxynaphthalene-3,6-disulfonic acid, 2-amino-5-hydroxynaphthalene-1,7-disulfonic acid and 1,8-dihydroxynaphthalene-3,6-disulfonic acid.

Among them, 1-amino-8-hydroxynaphthalene-2,4-disulfonic acid, 1-amino-8-hydroxynaphthalene-3,6-disulfonic acid, 1-amino-8-hydroxynaphthalene-4,6-disulfonic acid and 2-amino-5-hydroxynaphthalene-1,7-disulfonic acid are particularly preferred.

Among the dyes represented by the formula(1), some types can be produced by a conventional demetalization of the dye represented by the formula(2), such as treating the dye of the formula(2) with strong acidic aqueous medium or a demetalization by using a chelating agent such as ethylenediamine tetraacetic acid.

Each of X and Y in the formula(1) or the formula(2) may be azo group or azoxy group. The dye of the formula(1) or the formula(2) may be the mixture of the dye wherein X and/or Y is azo group and the dye wherein X and/or Y is azoxy group. The ratio of the dye wherein X and/or Y is azo group to the dye wherein X and/or Y varies depending on the reduction conditions. The dye wherein each of X and Y is an azoxy group or a mixture of an azo and azoxy group is preferred.

The dye of the formula(1) and the formula(2) usually have one or more anionic groups such as sulfo or carboxy, which give the dye water solubility. Though the dye having the anionic group usually used in the sodium salt form, it can also be used in the free acid form or in the form of other salt such as lithium salt, potassium salt, ammonium salt, ethanolamine salt or alkyl amine salt.

The dye of the formula(1) includes novel compounds. As the important examples of the novel compounds, a compound represented by the following formula(1-a) in the free acid form;

wherein Ra1 and Ra2 are same or different and each independently hydroxy or amino, Rb1 and Rb2 are same or different and each independently hydrogen, hydroxy or amino, Rc1 and Rc2 are same or different and each independently hydrogen, methyl or methoxy and p and q are same or different and each independently 0 or 1; and a compound represented by the following formula(1-b) in the free acid form;

wherein Rb3 and Rb4 are same or different and each independently hydrogen, hydroxy or amino and r and t are same or different and each independently 0 or 1 can be mentioned.

15 These compound of the formula(1-a) or (1-b) can be in the form of free acid or in the form of salt, such as lithium salt, sodium salt, potassium salt, ammonium salt, ethanolamine salt or alkylamine salt.

The polarizing film of the present invention which comprises at least one type of the dye selected from the dyes represented by the formula(1) or (2) may further comprises other organic dyes to modify the color tone or to improve the polarizing activities. As the other organic dyes, any dyes which have high dichromatic activity and also have the absorption ranges different to those of the dye of the formul(1) and/or (2) can be used. As examples of the other organic dyes, the following can be mentioned:

20 C.I. Direct Yellow 12, C.I. Direct Yellow 28, C.I. Direct Yellow 44, C.I. Direct Yellow 142, C.I. Direct Orange 6, C.I. Direct Orange 26, C.I. Direct Orange 39, C.I. Direct Orange 107, C.I. Direct blue 1, C.I. Direct blue 15, C.I. Direct blue 71, C.I. Direct blue 78, C.I. Direct blue 98, C.I. Direct blue 168, C.I. Direct blue 202, C.I. Direct Red 2, C.I. Direct Red 31, C.I. Direct Red 79, C.I. Direct Red 81, C.I. Direct Red 240, C.I. Direct Red 247, C.I. Direct Brown 106, C.I. Direct Brown 223, C.I. Direct Violet 9, C.I. Direct Violet 51 and C.I. Direct Green 85.

The polarizing film which comprises at least one type of the dye selected from the dyes represented by the formula(1) or (2) and further comprises at least two types of dyes selected from the above-mentioned group[A], [B] or [C] is more preferred. The more preferred polarizing film has neutral color and is little pervious to light at crossed state over the visible radiation wavelength region, particularly from 400 to 700nm. The more preferred polarizing film is excellent in polarizing activities and causes no discoloration and deterioration of polarizing activities under a high temperature and high humid conditions. Among the more preferred polarizing film, a polarizing film which comprises one type of dye represented by the formula(1), one type of dye selected from the group[A] and one type of dye selected from the group[C] is particularly preferred.

35 Among the disazo dyes represented by the formula(3), the copper complex salt thereof is preferred. That is, Me' in the formula(3) is preferably copper.

In the formula(3), A1 is phenyl or naphthyl group which may be optionally substituted. Examples of the substituent of the phenyl group include sulfo, sulfamoyl, nitro, C₁-C₄ alkyl, C₁-C₄ alkoxy, carboxy, halogen, unsubstituted amino, mono-substituted amino and di-substituted amino. Examples of the substituent of the amino group include C₁-C₄ alkyl, C₁-C₄ alkyl which is substituted by hydroxy or cyano and C₁-C₄ alkylcarbonyl. Among the phenyl groups denoted by A1, phenyl which is substituted by one or two substituents selected from sulfo, sulfamoyl, nitro, methyl, ethyl, methoxy, ethoxy, carboxy, chlorine, unsubstituted amino and substituted amino is preferred, and sulfophenyl is particularly preferred.

45 Examples of the group which can be the substituent of the naphthyl denoted by A1 include sulfo and hydroxy. Among the naphthyl group, naphthyl substituted by one, two or three sulfo groups is preferred, and particularly preferred is monosulfonaphthyl or disulfonaphthyl.

In the formula(3), B1 is 1-naphthol or 2-naphthol residue which may be optionally substituted. Among them, unsubstituted or substituted 1-naphthol residue is preferred. Examples of the group which can be the substituent of the 1-naphthol or 2-naphthol include sulfo, hydroxy, substituted amino and unsubstituted amino, provided that the hydroxy is not substituted at a position adjacent to the azo group. The substituted amino group may be either mono- or disubstituted and examples of the substituent of the amino include C₁-C₄ alkyl, C₁-C₄ alkylcarbonyl, carbamoyl, sulfamoyl, unsubstituted or substituted phenyl and unsubstituted or substituted benzoyl. Examples of the group which can be the substituent of the phenyl group or the benzoyl group include sulfo, amino and C₁-C₄ alkoxy.

55 In the formula(3), R3 is hydrogen, lower alkyl, lower alkoxy, sulfo or substituted or unsubstituted amino. As the lower alkyl, methyl or ethyl is preferred and particularly preferred is methyl. As the lower alkoxy, methoxy or ethoxy is preferred and particularly preferred is methoxy. The substituted amino can be mono- or disubstituted amino and examples of the group which can be the substituent of the amino group include C₁-C₄ alkyl.

C₁-C₄ alkylcarbonyl, C₁-C₄ alkylsulfonyl and carbamoyl.

In the formula(4), A2 and B2 is phenyl or naphthyl group which may be optionally substituted. Examples of the group which can be the substituent of the phenyl group include sulfo, sulfamoyl, nitro, C₁-C₄ alkyl, C₁-C₄ alkoxy, carboxy, hydroxy, halogen and unsubstituted or substituted amino. Examples of the group which can be the substituent of the naphthyl group include sulfo, hydroxy and unsubstituted or substituted amino. The substituted amino can be mono- or disubstituted amino and examples of the group which can be the substituent of the amino group include C₁-C₄ alkyl, C₁-C₄ alkyl which is substituted by hydroxy or cyano, C₁-C₄ alkylcarbonyl, phenyl, sulfophenyl, disulfophenyl, benzyl and carbamoyl.

The phenyl group denoted by A2 is preferably phenyl which is substituted by one or two substituents selected from sulfo, sulfamoyl, nitro, methyl, ethyl, methoxy, ethoxy, carboxy, chlorine, unsubstituted amino and substituted amino and particularly preferred is sulfophenyl.

The naphthyl group denoted by A2 is preferably naphthyl substituted by one, two or three sulfo groups and particularly preferred is monosulfonaphthyl or disulfonaphthyl.

As the phenyl denoted by B2, one of the following is preferred:

1 Phenyl which is substituted by one or two amino groups which may be optionally substituted, and may be further substituted by hydroxy, sulfo, C₁-C₄ alkyl, C₁-C₄ alkoxy or carboxy.

2 Phenyl which is substituted by one, two or three hydroxy groups, and may be further substituted by amino, which may be optionally substituted, sulfo, C₁-C₄ alkyl, C₁-C₄ alkoxy or carboxy.

As the naphthyl denoted by B2, one of the following is preferred:

1 Naphthyl which is substituted by one or two hydroxy groups, and may be further substituted by sulfo, unsubstituted amino or amino which is substituted by methyl, acetyl, phenyl, sulfophenyl, disulfophenyl or benzoyl.

2 Naphthyl which is substituted once or twice by unsubstituted amino or amino which is substituted by methyl, ethyl, hydroxyethyl, cyanoethyl, acetyl or carbamoyl and may be further substituted by hydroxy or sulfo.

In formula(4), R4 is hydrogen, lower alkyl, lower alkoxy, sulfo or amino which may be optionally substituted. The substituted amino can be mono- or di-substituted amino, and examples of the group which can be the substituent of the amino include C₁-C₄ alkyl, C₁-C₄ alkylcarbonyl, C₁-C₄ alkylsulfonyl and carbamoyl. R5 is hydrogen, hydroxy or lower alkoxy. In the case of the trisazo dye of formula(4) forming a copper complex salt, the copper complex salt is formed between the hydroxy group of 1-hydroxy-3-sulfo-2, 6-naphthylene group in formula(4) (it may have sulfo at 5-position) and the hydroxy group denoted by R5.

The disazo dye represented by formula(3) can be produced according to a known process such as the process described in DE 32 36 238 A or JP-B-64-5623, which comprises a conventional diazotization, coupling reaction and formation of metal complex salt.

The trisazo dye represented by formula(4) or a copper-complex salt thereof can be produced according to a known process such as the process described in JP-A-2-75672 which comprises a conventional diazotization and coupling reaction and, in the case of the copper complex salt, further comprises a formation of copper complex salt.

Preferable examples of [A]the disazo dye of the formula(3) include those represented by the following formulae of (3-1) - (3-24) in the free acid form.

Preferable examples of [B]the trisazo dye of the formula(4) and its copper complex salt include those represented by the following formulae of (4-1) - (4-11) in the free acid form.

These are usually used in the form of sodium salt, though they can also be used in the form of free acid, other alkali metal salt, such as lithium salt or potassium salt, ammonium salt or amine salt, such as ethanolamine salt or alkylamine salt.

The dyes of the group [C] are commercially available and can be obtained easily. They are on the market by Sumitomo Chemical Co., Ltd. and their Color Index Generic Names and trade names are described below:

- C.I. Direct Yellow 12
(trade name : Chrysophenine).
- C.I. Direct Yellow 28
(trade name : Sumilight Supra Yellow BC conc.).
- C.I. Direct Yellow 44
(trade name : Direct Fast Yellow GC).
- C.I. Direct Orange 26
(trade name : Direct Fast Orange S).
- C.I. Direct Orange 39
(trade name : Sumilight Supra Orange 2GL 125%).
- C.I. Direct Orange 107
(trade name : Sumilight Supra Orange GD extra conc.).
- C.I. Direct Red 2
(trade name : Benzopurpurine 4B).
- C.I. Direct Red 31
(trade name : Nippon Fast Red BB conc.).
- C.I. Direct Red 79
(trade name : Sumilight Supra Red 4BL 170%).
- C.I. Direct Red 81
(trade name : Sumilight Red 4B) and
- C.I. Direct Red 247
(trade name : Japanol Fast Red FA)

The compounds of formulae (1) to (8) may be used, for instance, in free acid form or as a salt thereof.

The polarizing film of the present invention can be produced by incorporating dichromatic dyes of the formula (1) and/or (2) and, if desired, other organic dyes into a film substrate of the polarizing film according to a known method. A polymer film is usually used as the film substrate.

Examples of the polymer film usable for the substrate of the polarizing film include polyvinyl alcohol or derivatives thereof; the same which is modified with an olefin such as ethylene and propylene, an unsaturated fatty acid such as crotonic acid, acrylic acid, methacrylic acid or maleic acid, EVA (ethylene-vinyl acetate) resin, a saponified EVA resin; a nylon resin; and a polyester resin. A film of polyvinyl alcohol or derivatives thereof is particularly preferred from the view points of the dye fixation and the orientation.

Incorporation of the dichromatic dye into a polymer film is carried out usually by dyeing the polymer film. The dyeing is, for example, carried out by dipping the polymer film in a dye bath prepared by dissolving the dichromatic dye into water. Though the dye concentration in the dye bath is not limited, it is usually in the range from 0.0001 to 10 % by weight. If desired, a dyeing auxiliary, such as sodium sulfate, preferably the concentration being from 1 to 10 % by weight, may be used. Dyeing temperature is from 40 to 80 °C to obtain preferable dye performance.

When at least two types of dyes selected from above-mentioned groups [A], [B] and [C] are used in addition to the dye of the formula (1) and/or the formula (2), their ratio is not critical, but usually the ratio of the total weight of the two or more types of dyes selected from groups [A], [B] and [C] to the total weight of the dye of the formula (1) and/or the formula (2) is from 0.1 to 5.0.

The orientation of the dichromatic dye incorporated in the polymer film is conducted by stretching the film.

Stretching the polymer film can be conducted according to a known method such as a wet stretching method or a dry stretching method. It may be conducted prior to the dyeing.

If desired, the oriented polymer film containing the dichromatic dyes is subjected to a post-treatment such as a boric acid treatment according to a known method in order to improve the light transmittance and polarizing activity of the polarizing film. Conditions for the boric acid treatment vary depending on the types of the polymer film and the dichromatic dyes employed. Usually, however, the treatment is carried out in aqueous boric acid solution having the concentration of from 1 to 15 % by weight, preferably from 5 to 10 % by weight, at a temperature of from 30 to 80 °C, preferably from 50 to 75 °C.

In combination with the boric acid treatment, if desired, the polymer film may further be subjected to a fixing treatment in aqueous solution containing a cationic polymer compound.

The dye-containing polarizing film thus obtained may be laminated with a protective film having excellent optical transparency and mechanical strength, on one or both sides of the film, to form a polarizing plate. As examples of the materials for the protective film, a fluorine type film such as tetrafluoroethylene/hexafluoro propylene copolymer film, polyester resin film, polyolefin resin film and polyamide resin film, as well as cellulose acetate film and acrylic film, which have been conventionally used, can be mentioned.

The present invention is now explained in more details with reference to the examples, which are only illustrative, and never construed to limit the invention. In the examples, "part" and "%" mean "part by weight" and "% by weight" respectively unless otherwise mentioned. In the formulae in the examples, the group represented by the following formula:

is an azoxy group or a mixture of azo group and azoxy group, which is obtained by the glucose reduction of a monoazo compound having a corresponding nitro group.

Synthesis Example 1

To 300 parts of water, 24 parts of 2-amino-5-hydroxynaphthalene-1,7-disulfonic acid was added and dissolved by using 28% aqueous sodium hydroxide solution. While keeping the resulting solution at pH10, aqueous solution of a diazonium compound which had been obtained by diazotizing 7 parts of p-nitroaniline was added thereto and the coupling reaction was carried out. After the reaction was completed, the reaction mass was adjusted at pH7 and filtered to obtain a monoazo compound, of which the free acid form is represented by the following formula:

The monoazo compound was added to 400 parts of water and dissolved. After making the resulting solution strongly alkaline condition, 8 parts of glucose was added thereto and the reduction was carried out at 40 °C. After the reaction was completed, the reaction mass was adjusted at pH7 and filtered to obtain a compound, of which the free acid form is represented by the following formula (a):

15 Measured in an aqueous medium, λ_{max} of this compound is 540 nm. Mass spectrum of this compound has a signal corresponding to the molecular weight of the compound represented by the following compound:

Synthesis Example 2

30 Into 300 parts of water, 22 parts of 1-amino-8-hydroxynaphthalene-2,4-disulfonic acid was added and dissolved by using 28% aqueous sodium hydroxide solution. While keeping the resulting solution at pH10, aqueous solution of a diazonium compound which had been obtained by diazotizing 8 parts of p-nitro-o-anisidine was added thereto and the coupling reaction was carried out. After the reaction was completed, the reaction mass was adjusted at pH7 and filtered to obtain a monoazo compound, of which the free acid form is represented by the following formula:

45 The monoazo compound was added to 400 parts of water and dissolved. After making the resulting solution strongly alkaline condition, 8 parts of glucose was added thereto and the reduction was carried out at 40 °C. After the reaction was completed, the reaction mass was adjusted at pH7 and filtered to obtain a compound, of which the free acid form is represented by the following formula:

The compound thus obtained was dissolved in 380 parts of water. Keeping the temperature of the solution

at 85 °C, 15 parts of monoethanol amine and 250 parts of 5% aqueous copper sulfate solution was added thereto to form the copper complex salt of the compound. After the reaction was completed, the reaction mass was adjusted at pH7, salted out by adding sodium chloride and filtered to obtain a compound, of which the free acid form is represented by the following formula (b):

5

Measured in an aqueous medium, λ_{\max} of this compound is 638 nm.

20 Synthesis Example 3

Into 300 parts of water, 16 parts of 1-amino-8-hydroxynaphthalene-3,6-disulfonic acid was added and dissolved by using 28% aqueous sodium hydroxide solution. While keeping the resulting solution at 5 °C and pH10, aqueous solution of a diazonium compound which had been obtained by diazotizing 8 parts of p-nitro-o-anisidine was added thereto and the coupling reaction was carried out. After the reaction was completed, the reaction mass was salted out by adding sodium chloride and filtered to obtain a monoazo compound, of which the free acid form is represented by the following formula:

The monoazo compound thus obtained was dissolved in 300 parts of water. After making the resulting solution strongly alkaline condition, 5 parts of glucose was added thereto and the reduction was carried out at 40 °C. After the reaction was completed, the reaction mass was adjusted at pH7 and filtered to obtain a compound, of which the free acid form is represented by the following formula:

40

The compound thus obtained was dissolved in 500 parts of water. While keeping the temperature of the solution at 95 °C, 15 parts of monoethanol amine and 250 parts of 5% copper sulfate solution was added thereto to form the copper complex salt of the compound. After the reaction was completed, the reaction mass was adjusted at pH7, salted out by adding sodium chloride and filtered to obtain a compound, of which the free acid form is represented by the following formula:

55

Then, the compound was dissolved in 500 parts of water and 44 parts of ethylenediamine tetra acetic acid was added to the resulting solution. After pH of the solution was adjusted at 5.5, while keeping the temperature of the solution at 60°C, the reaction was carried out for two hours. After the reaction was completed, the reaction mass was salted out by adding sodium chloride and filtered to obtain a compound, of which the free acid form is represented by the following formula (c):

Measured in an aqueous medium, λ_{max} of this compound is 625 nm.

Synthesis Example 4

Synthesis Example 3 was repeated, except that 1-amino-8-hydroxynaphthalene-3,6-disulfonic acid was replaced by 1-amino-8-hydroxynaphthalene-4,6-disulfonic acid to obtain a compound, of which the free acid form is represented by the following formula (d):

Measured in an aqueous medium, λ_{max} of this compound is 620 nm.

By using the dyes obtained in Synthesis Examples or other dyes, polarizing films were prepared as described in the following Examples. In the following Examples, light transmittance was measured by TC-1800M manufactured by Tokyo Denshoku Ltd. "T" represents the value of light transmittance at a specific wave length and "Y" represents the value of "visible sensitivity adjusted light transmittance" calculated according to JIS Z 8701 (Specification of Colors According to XYZ Standard Colorimetric System and X₁₀Y₁₀Z₁₀ Supplementary Standard Colorimetric System). The term "single transmittance" means "T" or "Y" measured for one piece of the polarizing film.

T(parallel) and Y(parallel) are values of T and Y of two pieces of the polarizing films, respectively, which are measured in the state wherein the both films are superposed upon each other so that they have same orientation directions (these light transmittances are called parallel light transmittance). T(cross) and Y(cross) are values of T and Y of two pieces of the polarizing film, respectively, which are measured at crossed state (these light transmittances are called "cross light transmittance").

The term "degree of polarization (P)" in Examples 1, 3 and 4 means a value obtained from T(parallel) and

T(cross) measured at λ_{max} , according to the following equation.

$$P = \sqrt{\frac{T(\text{parallel}) - T(\text{cross})}{T(\text{parallel}) + T(\text{cross})}} \cdot 100$$

The term "degree of polarization (Py)" in Example 6 means a value obtained from Y(parallel) and Y(cross) according to the following equation.

$$P_y = \sqrt{\frac{Y(\text{parallel}) - Y(\text{cross})}{Y(\text{parallel}) + Y(\text{cross})}} \cdot 100$$

$\Delta T(\text{cross})$ represent the difference between the maximum and the minimum values of cross light transmittance T(cross) measured within the wavelength range of 400-700nm. Tmax(cross) represent the maximum value of cross light transmittance T(cross) measured within the wavelength range of 400-700nm. $\Delta T(\text{cross})$ and Tmax(cross) are parameters indicating the degree of seriousness of the film to light at crossed state.

Example 1.

A polyvinyl alcohol film of 75 μ m in thickness (Kuraray Vinyon #7500 manufactured by Kuraray Co., Ltd.) was stretched to five times of its original length in a longitudinal uniaxial direction to prepare the substrate of a polarizing film. The resulting film was dipped for 12 minutes, as kept in the tensioned state, into aqueous solution of sodium salt of dye of the formula(a) and sodium sulfate, wherein the concentrations of the dye and sodium sulfate being 0.025% and 2% respectively, at 65 °C. Thereafter, the film was dipped into 7.5% aqueous boric acid solution at 65 °C for 5 minutes and then washed with 20 °C water for 20 seconds to obtain a polarizing film. The polarizing film thus obtained had a high polarizing activity and did not cause discoloration even after having been kept for a long period of time at a high temperature under a highly humid condition. The light polarization characteristics of the polarizing film are shown in Table 1.

Example 2.

Example 1 was repeated, except that the dye used in Example 1 was replaced by sodium salt of the dye of the formula(b) to obtain a polarizing film. The polarizing film thus obtained did not cause discoloration even after having been kept for a long period of time at a high temperature under a highly humid condition.

Example 3

Example 1 was repeated, except that the dye used in Example 1 was replaced by sodium salt of dye of the formula(c) to obtain a polarizing film. The polarizing film thus obtained had a high polarizing activity. The light polarization characteristics of the polarizing film are shown in Table 1.

Example 4

Example 1 was repeated, except that the dye used in Example 1 was replaced by sodium salt of dye of the formula(d) to obtain a polarizing film. The polarizing film thus obtained had a high polarizing activity. The light polarization characteristics of the polarizing film are shown in Table 1.

Table 1

Example No.	λ_{max} , nm	single transmittance (T) %	degree of polarization (P)%
1	540	42.2	99.4
3	650	42.0	99.2
4	650	42.2	98.8

Example 5.

A polyvinyl alcohol film of 75 μ m in thickness (Kuraray Vinyon #7500 manufactured by Kuraray Co., Ltd.) was stretched to four times of its original length in a longitudinal uniaxial direction to prepare the substrate of a polarizing film. The resulting film was dipped for 10 minutes, as kept in the tensioned state, into aqueous solution of sodium salt of dye of the formula(a), sodium salt of dye of the formula(b), C.I. direct orange 39 and sodium sulfate, wherein the concentrations of the dye of the formula(a), the dye of the formula(b), C.I. direct

orange 39 and sodium sulfate being 0.012%, 0.105%, 0.008% and 2% respectively, at 60°C. Thereafter, the film was dipped into 7.5% aqueous boric acid solution at 65°C for 10 minutes and then washed with 20°C water for 30 seconds to obtain a polarizing film. The polarizing film thus obtained has a neutral color and did not cause discoloration even after having been kept for a long period of time at a high temperature under a highly humid condition.

Example 6.

A polyvinyl alcohol film of 75 μ m in thickness (Kuraray Vinyon #7500 manufactured by Kuraray Co., Ltd.) was stretched to five times of its original length in a longitudinal uniaxial direction to prepare the substrate of polarizing film. The resulting film was dipped for 8 minutes, as kept in the tensioned state, into aqueous solution of sodium salt of dye of the formula(a), sodium salt of dye of the formula(3-20), C.I. direct orange 39 and sodium sulfate, wherein the concentrations of the dye of the formula(a), the dye of the formula(3-20), C.I. direct orange 39 and sodium sulfate being 0.0195%, 0.05%, 0.0085% and 2% respectively, at 70°C. Thereafter, the film was dipped into 7.5% aqueous boric acid solution at 69°C for 5 minutes and then washed with 20°C water for 20 seconds to obtain a polarizing film. The polarizing film had high degree of polarization and was little pervious to light at crossed state. The light polarization characteristics of the polarizing film are shown below.

single transmittance $Y = 40.1 \%$

degree of polarization $P_y = 99.2 \%$

$T_{\max}(\text{cross}) = 1.08 \%$

$\Delta T(\text{cross}) = 1.02 \%$.

The polarizing film thus obtained has a neutral color and did not cause discoloration even after having been kept for a long period of time at a high temperature under a highly humid condition.

Examples 7 - 24

Example 1 was repeated, except that sodium salt of the dye used in Example 1 was replaced by a sodium salt of the dye shown in Table 2 in the free acid form to obtain a polarizing film.

In the Table 2, λ_{\max} , means λ_{\max} , measured as the polarizing film.

The dye-containing polarizing film of the present invention exhibits high polarizing activities not smaller than those of a iodine containing polarizing film and has excellent durability. Hence, the polarizing film of the present invention is preferably applied to a variety of liquid crystal displays, particularly to displays for automobiles which require excellent polarizing activities and durability and to displays for industrial instruments used in a variety of circumstances. By using several types of the specific dye in combination, a polarizing film which is little pervious to light over the visible wavelength region at crossed state can be obtained.

This invention also provides novel dyes suitable for producing the polarizing film.

Claims

1. A polarizing film which comprises, in a film substrate, at least one dye selected from:

1) a dye of formula (1):

wherein:

Q^1 and Q^4 , which are the same or different, are each unsubstituted or substituted phenyl or naphthyl;

Q^2 and Q^3 , which are the same or different, are each unsubstituted or substituted phenylene;

and

X is -N=N- or

provided that, when X is -N=N- and both of Q^2 and Q^3 are unsubstituted phenylene, at least one of Q^1

and Q⁴ is not phenyl which is substituted only by an alkyl-substituted amino or is not phenyl substituted by an alkyl-substituted amino and by methyl; and
 2) a dye of formula (2):

wherein:

each Me, which are the same or different, is a transition metal selected from copper, nickel, zinc and iron;

Q⁵ and Q⁶, which are the same or different, are each an unsubstituted or substituted 1,2-naphthylene group;

Y is -N=N- or

and

R¹ and R², which are the same or different, are each hydrogen, lower alkyl, lower alkoxy or sulfo.

2. A film according to claim 1 which comprises the dye of formula (1) wherein Q¹ and Q⁴ which are the same or different, are naphthyl having at least one substituent selected from sulfo, hydroxy, lower alkyl, lower alkoxy, unsubstituted amino and substituted amino, or phenyl having at least one substituent selected from hydroxy, unsubstituted amino and substituted amino.
3. A film according to claim 1 or 2 which comprises the dye of formula (1) wherein Q² and Q³, which are the same or different, are each unsubstituted p-phenylene or p-phenylene substituted by one or two substituents selected from hydroxy, lower alkyl, lower alkoxy and sulfo.
4. A film according to any one of the preceding claims which comprises the dye of formula (2) wherein Q⁵ and Q⁶, which are the same or different, are each a 1,2-naphthalene group having at least one substituent selected from sulfo, hydroxy, carboxy, lower alkyl, lower alkoxy, unsubstituted amino and substituted amino.
5. A film according to any one of the preceding claims which comprises the dye of formula (2) wherein Me is copper.
6. A film according to any one of the preceding claims which comprises at least two dyes selected from:
 - (A) a disazo dye of formula (3).

wherein:

Me' is a transition metal selected from copper, nickel, zinc and iron;

A' is unsubstituted or substituted phenyl or naphthyl;

B¹ is an unsubstituted or substituted 1,2-naphthalene group; and
 R³ is unsubstituted or substituted amino, hydrogen, lower alkyl, lower alkoxy or sulfo;
 (B) a trisazo dye of formula (4) or a copper complex salt thereof.

wherein:

A² and B², which are the same or different, are each unsubstituted or substituted phenyl or naphthyl;

R⁴ is unsubstituted or substituted amino, hydrogen, lower alkyl, lower alkoxy or sulfo;

R⁵ is hydrogen, hydroxy or lower alkoxy, and

m is 0 or 1;

or a salt thereof; and

(C) C.I. Direct Yellow 12, C.I. Direct Yellow 28, C.I. Direct Yellow 44, C.I. Direct Orange 26, C.I. Direct Orange 39, C.I. Direct Orange 107, C.I. Direct Red 2, C.I. Direct Red 31, C.I. Direct Red 79, C.I. Direct Red 81 and C.I. Direct Red 247.

7. A film according to claim 6 which comprises at least one disazo dye of formula (3) in which Me' is copper.
8. A film according to claim 6 or 7 which comprises at least one dye of formula (1), at least one disazo dye selected from group (A) and at least one dye selected from group (C).
9. A compound of formula (1-a):

wherein:

Ra¹ and Ra², which are the same or different are each hydroxy or amino;

Rb¹ and Rb², which are the same or different, are each hydrogen, hydroxy or amino;

Rc¹ and Rc², which are the same or different, are each hydrogen, methyl or methoxy, and

p and q, which are the same or different, are each 0 or 1;

or a salt thereof.

10. A compound of formula (1-b):

wherein:

Rb³ and Rb⁴, which are the same or different, are each hydrogen, hydroxy or amino; and r and t, which are the same or different, are each 0 or 1; or a salt thereof.
